

Grout Cleaning

PRODUCTS & PROCEDURES

A simple effective solution for cleaning grout in restrooms, kitchens, and any stone or ceramic floor area where grout cleaning is a problem. The system combines 3 specially designed chemicals (Grout Cleaner, Grout Brightener, Grout Shield) and equipment that penetrate dirt and scum in uneven grouted flooring and restores the grout to it's original condition.

Before

Cleaning Grout

After

Step One

Mix Grout Cleaner 1:5 parts water in a mop bucket; apply generously to floor. Allow the Grout Cleaner solution to sit for 10 minutes prior to scrubbing.

Step Two

Begin scrubbing grout with the floor machine and scrub brush attachment (using a standard floor pad is not recommended for this program). Scrub floor repeatedly along the grout lines in all directions.

Step Three

Pick up solution with a wet/dry vacuum. Rinse floor thoroughly with clear rinse water.

Step Four

Mix grout Brightener 1:5. Scrub floor along grout line in all directions. Pick up solution with wet/dry vacuum and rinse with clear water. After finishing, wash and rinse tools. As the grout dries you will notice a significantly improved appearance and the elimination of foul odors in the restroom.

Note: This step is required periodically to maintain the grout brightness.

Step Five

Floor must be **totally dry, cleaned and restored** prior to applying Grout Shield Protective Barrier. Apply Grout Shield with pump sprayer. Mist lightly, do not over spray on tile, wipe excess product off of ceramic tile. Allow to dry thoroughly before walking on area. (20-30 minutes)
